

IN THE CLAIMS

Claim 1 has been amended as follows:

1. (Currently Amended) An acoustic gas analyzer comprising:

an acoustic velocity meter disposed and adapted to interact with a gas to be analyzed by emitting acoustic energy into the gas and detecting said acoustic energy after transmission through the gas, said acoustic velocity meter emitting a first output having an amplitude dependent on the detected transmission of the acoustic energy through the gas at a detection time;

a temperature probe adapted to interact with the gas to measure a temperature of the gas, and emitting a second output indicative of the a measured temperature of the gas, said temperature probe having a probe time constant that causes said measured temperature to represent a temperature of the gas at a time that does not coincide with said detection time;

a signal processor comprising a filter supplied with said first output for producing a time-dependent variation of the amplitude of, ~~from~~ said first output, a temporally-adapted first output dependent on the probe time constant that represents a temperature of the gas at the detection time; and

a calculation unit supplied with said temporally adapted first output and with said second output for determining compositional information of the gas from said temporally-adapted first output and said second output.

Claim 2 has been cancelled.

2. (Cancelled)

Claim 3 has been amended as follows:

3. (Currently amended) An acoustic gas analyzer as claimed in claim ~~[[2]]~~ 1 wherein said filter arrangement comprises a recursive filter having a filter constant that is substantially equal to the probe time constant.

4. (Original) An acoustic gas analyzer as claimed in claim 3 wherein said recursive filter is a digital filter.
